Week 2

Logic, Proofs, Boolean Algebra

- Textbook (R & W) - Ch. 2, Sec. 2.2-2.5
Ch. 10, Sec. 10.1-10.5
- Problem set 2
- Supplementary Exercises Ch. 2, Ch. 10 (R & W)
- *Guidelines for good mathematical writing*
- Quiz 2 — due Monday 4 March (week 3) at 11am

Logical Equivalence

Two formulas ϕ, ψ are **logically equivalent**, denoted $\phi \equiv \psi$ if they have the same truth value for all values of their basic propositions.

Application: If ϕ and ψ are two formulae such that $\phi \equiv \psi$, then the digital circuits corresponding to ϕ and ψ compute the same function. Thus, proving equivalence of formulas can be used to *optimise* circuits.

Some Well-Known Equivalences

Excluded Middle	$p \vee \neg p \equiv \top$
Contradiction	$p \wedge \neg p \equiv \perp$
Identity	$p \vee \perp \equiv p$
	$p \wedge \top \equiv p$
	$p \vee \top \equiv \top$
	$p \wedge \perp \equiv \perp$
Idempotence	$p \vee p \equiv p$
	$p \wedge p \equiv p$
Double Negation	$\neg \neg p \equiv p$

Commutativity	$p \vee q \equiv q \vee p$
	$p \wedge q \equiv q \wedge p$
Associativity	$(p \vee q) \vee r \equiv p \vee (q \vee r)$
	$(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$
Distribution	$p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$
	$p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$
De Morgan's laws	$\neg(p \wedge q) \equiv \neg p \vee \neg q$
	$\neg(p \vee q) \equiv \neg p \wedge \neg q$
Implication	$p \Rightarrow q \equiv \neg p \vee q$
	$p \Leftrightarrow q \equiv (p \Rightarrow q) \wedge (q \Rightarrow p)$

Example

$$\begin{aligned}
 & ((r \wedge \neg p) \vee (r \wedge q)) \vee ((\neg r \wedge \neg p) \vee (\neg r \wedge q)) \\
 \equiv & (r \wedge (\neg p \vee q)) \vee (\neg r \wedge (\neg p \vee q)) && \text{Distrib.} \\
 \equiv & (r \vee \neg r) \wedge (\neg p \vee q) && \text{Distrib.} \\
 \equiv & \top \wedge (\neg p \vee q) && \text{Excl. Mid.} \\
 \equiv & \neg p \vee q && \text{Ident.}
 \end{aligned}$$

Exercise

2.2.18 Prove or disprove:

- (a) $p \Rightarrow (q \Rightarrow r) \equiv (p \Rightarrow q) \Rightarrow (p \Rightarrow r)$
 (c) $(p \Rightarrow q) \Rightarrow r \equiv p \Rightarrow (q \Rightarrow r)$

5

6

Satisfiability of Formulas

Exercise

2.2.18 Prove or disprove:

- (a) $(p \Rightarrow q) \Rightarrow (p \Rightarrow r)$
 $\equiv \neg(p \Rightarrow q) \vee (\neg p \vee r)$
 $\equiv (p \wedge \neg q) \vee \neg p \vee r$
 $\equiv (p \vee \neg p \vee r) \wedge (\neg q \vee \neg p \vee r)$
 $\equiv \top \wedge (\neg p \vee \neg q \vee r)$
 $\equiv p \Rightarrow (\neg q \vee r)$
 $\equiv p \Rightarrow (q \Rightarrow r)$

- (c) $(p \Rightarrow q) \Rightarrow r \equiv p \Rightarrow (q \Rightarrow r)$

Counterexample:

p	q	r	$(p \Rightarrow q) \Rightarrow r$	$p \Rightarrow (q \Rightarrow r)$
F	T	F	F	T

A formula is **satisfiable**, if it evaluates to T for *some* assignment of truth values to its basic propositions.

Example

A	B	$\neg(A \Rightarrow B)$
F	F	F
F	T	F
T	F	T
T	T	F

7

8

Applications II: Constraint Satisfaction Problems

These are problems such as timetabling, activity planning, etc.
Many can be understood as showing that a formula is satisfiable.

Example

You are planning a party, but your friends are a bit touchy about who will be there.

- ❶ If John comes, he will get very hostile if Sarah is there.
- ❷ Sarah will only come if Kim will be there also.
- ❸ Kim says she will not come unless John does.

Who can you invite without making someone unhappy?

Translation to logic: let J, S, K represent “John (Sarah, Kim) comes to the party”. Then the constraints are:

- ❶ $J \Rightarrow \neg S$
- ❷ $S \Rightarrow K$
- ❸ $K \Rightarrow J$

Thus, for a successful party to be possible, we want the formula $\phi = (J \Rightarrow \neg S) \wedge (S \Rightarrow K) \wedge (K \Rightarrow J)$ to be satisfiable.

Truth values for J, S, K making this true are called *satisfying assignments*, or *models*.

9

Navigation icons

10

Navigation icons

We figure out where the conjuncts are false, below. (so blank = T)

J	K	S	$J \Rightarrow \neg S$	$S \Rightarrow K$	$K \Rightarrow J$	ϕ
F	F	F				
F	F	T		F		F
F	T	F			F	F
F	T	T			F	F
T	F	F				
T	F	T	F	F		F
T	T	F				
T	T	T	F			F

Conclusion: a party satisfying the constraints can be held. Invite nobody, or invite John only, or invite Kim and John.

12

Navigation icons

Exercise

2.7.14 (supp)

Which of the following formulae are *always* true?

- (a) $(p \wedge (p \Rightarrow q)) \Rightarrow q$ — always true
- (b) $((p \vee q) \wedge \neg p) \Rightarrow \neg q$ — not always true
- (c) $((p \Rightarrow q) \vee (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$ — not always true
- (d) $(p \wedge q) \Rightarrow q$ — always true

Exercise

2.7.14 (supp)

Which of the following formulae are *always* true?

- (a) $(p \wedge (p \Rightarrow q)) \Rightarrow q$ — always true
- (b) $((p \vee q) \wedge \neg p) \Rightarrow \neg q$ — not always true
- (e) $((p \Rightarrow q) \vee (q \Rightarrow r)) \Rightarrow (p \Rightarrow r)$ — not always true
- (f) $(p \wedge q) \Rightarrow q$ — always true

An *argument* consists of a set of declarative sentences called *premises* and a declarative sentence called the *conclusion*.

Example

Premises:	Frank took the Ford or the Toyota. If Frank took the Ford he will be late. Frank is not late.
Conclusion:	Frank took the Toyota

13

Navigation icons

14

Navigation icons

An argument is *valid* if the conclusions are true *whenever* all the premises are true. Thus: if we believe the premises, we should also believe the conclusion.

(Note: we don't care what happens when one of the premises is false.)

Other ways of saying the same thing:

- The conclusion *logically follows* from the premises.
- The conclusion is a *logical consequence* of the premises.
- The premises **entail** the conclusion.

The argument above is valid. The following is invalid:

Example

Premises:	Frank took the Ford or the Toyota. If Frank took the Ford he will be late. Frank is late.
Conclusion:	Frank took the Ford.

15

Navigation icons

16

Navigation icons

For arguments in propositional logic, we can capture validity as follows:

Let ϕ_1, \dots, ϕ_n and ϕ be formulae of propositional logic. Draw a truth table with columns for each of ϕ_1, \dots, ϕ_n and ϕ .

The argument with premises ϕ_1, \dots, ϕ_n and conclusion ϕ is valid, denoted

$$\phi_1, \dots, \phi_n \models \phi$$

if in every row of the truth table where ϕ_1, \dots, ϕ_n are all true, ϕ is true also.

We mark only true locations (blank = F)

<i>Frd</i>	<i>Tyta</i>	<i>Late</i>	$Frd \vee Tyta$	$Frd \Rightarrow Late$	$\neg Late$	<i>Tyta</i>
F	F	F		T	T	
F	F	T		T		
F	T	F	T	T	T	T
F	T	T	T	T		T
T	F	F	T		T	
T	F	T	T	T		
T	T	F	T		T	T
T	T	T	T	T		T

This shows $Frd \vee Tyta, Frd \Rightarrow Late, \neg Late \models Tyta$

17

Navigation icons

18

Navigation icons

The following row shows $Frd \vee Tyta, Frd \Rightarrow Late, Late \not\models Frd$

<i>Frd</i>	<i>Tyta</i>	<i>Late</i>	$Frd \vee Tyta$	$Frd \Rightarrow Late$	<i>Late</i>	<i>Frd</i>
F	T	T	T	T	T	F

19

20

Navigation icons

Applications III: Reasoning About Requirements/Specifications

Suppose a set of English language requirements R for a software/hardware system can be formalised by a set of formulae $\{\phi_1, \dots, \phi_n\}$.

Suppose C is a statement formalised by a formula ψ . Then

- 1 The requirements cannot be implemented if $\phi_1 \wedge \dots \wedge \phi_n$ is not satisfiable.
- 2 If $\phi_1, \dots, \phi_n \models \psi$ then every correct implementation of the requirements R will be such that C is always true in the resulting system.
- 3 If $\phi_1, \dots, \phi_{n-1} \models \phi_n$, then the condition ϕ_n of the specification is redundant and need not be stated in the specification.

Example

Requirements R : A burglar alarm system for a house is to operate as follows. The alarm should not sound unless the system has been armed or there is a fire. If the system has been armed and a door is disturbed, the alarm should ring. Irrespective of whether the system has been armed, the alarm should go off when there is a fire.

Conclusion C : If the alarm is ringing and there is no fire, then the system must have been armed.

Question

- ① Will every system correctly implementing requirements R satisfy C ?
- ② Is the final sentence of the requirements redundant?

Expressing the requirements as formulas of propositional logic, with

- S = the alarm sounds = the alarm rings
- A = the system is armed
- D = a door is disturbed
- F = there is a fire

we get

Requirements:

- ① $S \Rightarrow (A \vee F)$
- ② $(A \wedge D) \Rightarrow S$
- ③ $F \Rightarrow S$

Conclusion: $(S \wedge \neg F) \Rightarrow A$

21

Navigation icons

22

Validity of Formulas

Our two questions then correspond to

- ① Does $S \Rightarrow (A \vee F), (A \wedge D) \Rightarrow S, F \Rightarrow S \models (S \wedge \neg F) \Rightarrow A$?
- ② Does $S \Rightarrow (A \vee F), (A \wedge D) \Rightarrow S \models F \Rightarrow S$?

Answers: problem set 2, exercise 2

A formula ϕ is **valid**, or a **tautology**, denoted $\models \phi$, if it evaluates to T for *all* assignments of truth values to its basic propositions.

Example

A	B	$(A \Rightarrow B) \Rightarrow (\neg B \Rightarrow \neg A)$
F	F	T
F	T	T
T	F	T
T	T	T

23

Navigation icons

24

Navigation icons

Validity, Equivalence and Entailment

Theorem

The following are equivalent:

- $\phi_1, \dots, \phi_n \models \psi$
- $\models (\phi_1 \wedge \dots \wedge \phi_n) \Rightarrow \psi$
- $\models \phi_1 \Rightarrow (\phi_2 \Rightarrow \dots (\phi_n \Rightarrow \psi) \dots)$

Theorem

$\phi \equiv \psi$ if and only if $\models \phi \Leftrightarrow \psi$

Proof Rules and Methods: Proof by Cases

We want to prove that A . To prove it, we find a set of cases B_1, B_2, \dots, B_n such that

- 1 $B_1 \vee \dots \vee B_n$, and
- 2 $B_i \Rightarrow A$ for each $i = 1..n$.

(Hard Part: working out what the B_i should be.)

(Comment: often $n = 2$ and $B_2 = \neg B_1$, so $B_1 \vee B_2 = B_1 \vee \neg B_1$ holds trivially.)

Example

$|x + y| \leq |x| + |y|$ for all $x, y \in \mathbb{R}$.

Recall:

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

25

26

Quantifiers

We've made quite a few statements of the kind

"If there exists a satisfying assignment ..."

"Every natural number greater than 2 ..."

or

without formally capturing these quantitative aspects.

Notation: \forall means "for all" and \exists means "there exist(s)"

Example

Goldbach's conjecture

$$\forall n \in 2\mathbb{N} (n > 2 \Rightarrow \exists p, q \in \mathbb{N} (p, q \in \text{PRIMES} \wedge n = p + q))$$

Exercise

always true

Which of the following is a tautology?

- $\forall x (\exists y (P(x, y))) \Rightarrow \exists y (\forall x (P(x, y)))$ not always true
- $\exists y (\forall x (P(x, y))) \Rightarrow \forall x (\exists y (P(x, y)))$ always true

27

28

Proof Rules and Methods: Proof of the Contrapositive

Exercise

Which of the following is a tautology?

- $\forall x (\exists y (P(x, y))) \Rightarrow \exists y (\forall x (P(x, y)))$ not always true
- $\exists y (\forall x (P(x, y))) \Rightarrow \forall x (\exists y (P(x, y)))$ always true

We want to prove $A \Rightarrow B$.

To prove it, we show $\neg B \Rightarrow \neg A$ and invoke the equivalence $(A \Rightarrow B) \equiv (\neg B \Rightarrow \neg A)$.

Example

$$\forall m, n \in \mathbb{N} (m + n \geq 73 \Rightarrow m \geq 37 \vee n \geq 37)$$

29

30

Proof Rules and Methods: Proof by Contradiction

We want to prove A .

To prove it, we assume $\neg A$, and derive both B and $\neg B$ for some proposition B .

(Hard part: working out what B should be.)

Examples

- $\sqrt{2}$ is irrational
- There exist an infinite number of primes

31

32

Substitution

Substitution is the process of replacing every occurrence of some symbol by an expression.

Examples

The result of substituting 3 for x in

$$x^2 + 7y = 2xz$$

is

$$3^2 + 7y = 2 \cdot 3 \cdot z$$

The result of substituting $2k + 3$ for x in

$$x^2 + 7y = 2xz$$

is

$$(2k + 3)^2 + 7y = 2 \cdot (2k + 3) \cdot z$$

Substitution Rules

We can substitute logical expressions for logical variables:

Example

The result of substituting $P \wedge Q$ for A in

$$(A \wedge B) \Rightarrow A$$

is

$$((P \wedge Q) \wedge B) \Rightarrow (P \wedge Q)$$

(a) If we substitute an expression for *all* occurrences of a logical variable in a tautology then the result is still a tautology.

If $\models \phi(P)$ then $\models \phi(\alpha)$.

Examples

$\models P \Rightarrow (P \vee Q)$, so

$$\models (A \vee B) \Rightarrow ((A \vee B) \vee Q)$$

2.5.7

$\models \neg Q \Rightarrow (Q \Rightarrow P)$, so

$$\models \neg(P \Rightarrow Q) \Rightarrow ((P \Rightarrow Q) \Rightarrow P)$$

33

Navigation icons

34

Boolean Functions

(b) If a logical formula ϕ contains a formula α , and we replace (an occurrence of) α by a logically equivalent formula β , then the result is logically equivalent to ϕ .

If $\alpha \equiv \beta$ then $\phi(\alpha) \equiv \phi(\beta)$.

Example

$P \Rightarrow Q \equiv \neg P \vee Q$, so

$$Q \Rightarrow (P \Rightarrow Q) \equiv Q \Rightarrow (\neg P \vee Q)$$

Formulae can be viewed as **Boolean functions** mapping valuations of their propositional letters to truth values.

A Boolean function of one variable is also called **unary**.

A function of two variables is called **binary**.

A function of n input variables is called **n-ary**.

Question

How many unary Boolean functions are there?

How many binary functions? n -ary?

Question

What connectives do we need to express all of them?

35

Navigation icons

36

Navigation icons

Boolean Arithmetic

Consider truth values with operations \wedge, \vee, \neg as an **algebraic structure**:

- $\mathbb{B} = \{0, 1\}$ with 'Boolean' arithmetic

$$a \cdot b, a + b, a' = 1 - a$$

NB

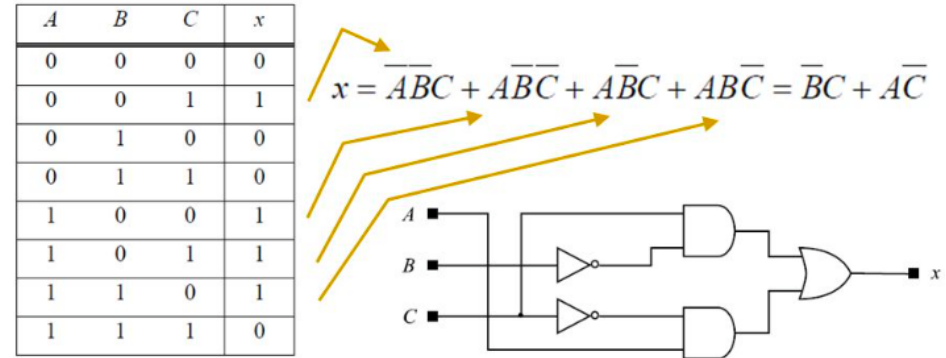

We often write pq for $p \cdot q$.

In electrical and computer engineering, the notation \bar{p} is more common than p' , which is often used in mathematics.

Observe that using $(\bar{\cdot})$ obviates the need for some parentheses.

Applications IV: Digital Circuits

A formula can be viewed as defining a digital circuit, which computes a Boolean function of the input propositions. The function is given by the truth table of the formula.

37

38

Definition: Boolean Algebra

Every structure consisting of a set T with operations *join*:

$a, b \mapsto a + b$, *meet*: $a, b \mapsto a \cdot b$ and *complementation*: $a \mapsto a'$,

and distinct elements 0 and 1, is called a **Boolean algebra** if it satisfies the following laws, for all $x, y, z \in T$:

commutative: • $x + y = y + x$

• $x \cdot y = y \cdot x$

associative: • $(x + y) + z = x + (y + z)$

• $(x \cdot y) \cdot z = x \cdot (y \cdot z)$

distributive: • $x + (y \cdot z) = (x + y) \cdot (x + z)$

• $x \cdot (y + z) = (x \cdot y) + (x \cdot z)$

identity: $x + 0 = x, x \cdot 1 = x$

complementation: $x + x' = 1, x \cdot x' = 0$

Exercise

Example 10.1.2 Define a Boolean algebra for 2-bit vectors \mathbb{B}^2

$$0 \stackrel{\text{def}}{=} (0, 0)$$

$$1 \stackrel{\text{def}}{=} (1, 1)$$

$$\text{join: } (a_1, a_2) + (b_1, b_2) \mapsto (a_1 + b_1, a_2 + b_2)$$

$$\text{meet: } (a_1, a_2) \cdot (b_1, b_2) \mapsto (a_1 \cdot b_1, a_2 \cdot b_2)$$

$$\text{complementation: } (a_1, a_2)' \mapsto (a_1', a_2')$$

Check that all Boolean algebra laws hold for $x, y \in \mathbb{B} \times \mathbb{B}$

39

40

Boolean Expressions

Exercise

Example 10.1.2 Define a Boolean algebra for 2-bit vectors \mathbb{B}^2

$$0 \stackrel{\text{def}}{=} (0, 0)$$

$$1 \stackrel{\text{def}}{=} (1, 1)$$

$$\text{join: } (a_1, a_2) + (b_1, b_2) \mapsto (a_1 + b_1, a_2 + b_2)$$

$$\text{meet: } (a_1, a_2) \cdot (b_1, b_2) \mapsto (a_1 \cdot b_1, a_2 \cdot b_2)$$

$$\text{complementation: } (a_1, a_2)' \mapsto (a_1', a_2')$$

Check that all Boolean algebra laws hold for $x, y \in \mathbb{B} \times \mathbb{B}$

Boolean algebra (BA) notation for propositional formulae:

	PL	BA
propositional atoms	p, q, \dots	p, q, \dots
conjunction	$p \wedge q$	$p \cdot q$ or pq
disjunction	$p \vee q$	$p + q$
negation	$\neg p$	p'

Example

$$(p \vee q) \wedge (\neg(p \vee \neg q) \vee \neg(\neg(r \wedge (p \vee \neg q))))$$

$$\begin{aligned} & (p + q) \cdot ((p + q')' + (r \cdot (p + q'))'') \\ &= (p + q)((p + q')' + (r(p + q'))'') \end{aligned}$$

41

Terminology and Rules

- A **literal** is an expression p or p' , where p is a propositional atom.
- An expression is in CNF (conjunctive normal form) if it has the form

$$\prod_i C_i$$

where each **clause** C_i is a disjunction of literals e.g. $p + q + r'$.

- An expression is in DNF (disjunctive normal form) if it has the form

$$\sum_i C_i$$

where each clause C_i is a conjunction of literals e.g. pqr' .

- CNF and DNF are named after their top level operators; no deeper nesting of \cdot or $+$ is permitted.
- We can assume in every clause (disjunct for the CNF, conjunct for the DNF) any given variable (literal) appears only once; preferably, no literal and its negation together.
 - $x + x = x$, $xx = x$
 - $xx' = 0$, $x + x' = 1$
 - $x \cdot 0 = 0$, $x \cdot 1 = x$, $x + 0 = x$, $x + 1 = 1$
- A preferred form for an expression is DNF, with as few terms as possible. In deriving such minimal simplifications the two basic rules are **absorption** and **combining the opposites**.

Fact

- 1 $x + xy = x$ (*absorption*)
- 2 $xy + xy' = x$ (*combining the opposites*)

43

44

Step 1: Push Negations Down

Theorem

For every Boolean expression ϕ , there exists an equivalent expression in conjunctive normal form and an equivalent expression in disjunctive normal form.

Proof.

We show how to apply the equivalences already introduced to convert any given formula to an equivalent one in CNF, DNF is similar. \square

Using **De Morgan's** laws and the **double negation** rule

$$(x + y)' = x' \cdot y'$$

$$(x \cdot y)' = x' + y'$$

$$(x')' = x$$

we push negations down towards the atoms until we obtain a formula that is formed from literals using only \cdot and $+$.

45

Navigation icons

46

Step 2: Use Distribution to Convert to CNF

Using the distribution rules

$$x + (y_1 \cdot \dots \cdot y_n) = (x + y_1) \cdot \dots \cdot (x + y_n)$$

$$(y_1 \cdot \dots \cdot y_n) + x = (y_1 + x) \cdot \dots \cdot (y_n + x)$$

we obtain a CNF formula.

47

Navigation icons

48

CNF/DNF in Propositional Logic

Using the equivalence

$$A \Rightarrow B \equiv \neg A \vee B$$

we first eliminate all occurrences of \Rightarrow

Example

$$\neg(\neg p \wedge ((r \wedge s) \Rightarrow q)) \equiv \neg(\neg p \wedge (\neg(r \wedge s) \vee q))$$

Navigation icons

Step 1:

Example

$$\begin{aligned}
 (p'((rs)' + q))' &= (p')' + ((rs)' + q)' \\
 &= p + (rs')' \cdot q' \\
 &= p + rsq'
 \end{aligned}$$

Step 2:

Example

$$\begin{aligned}
 p + rsq' &= (p + r)(p + sq') \\
 &= (p + r)(p + s)(p + q') \quad \text{CNF}
 \end{aligned}$$

Canonical Form DNF

Given a Boolean expression E , we can construct an equivalent DNF E^{dnf} from the lines of the truth table where E is true:

Given an assignment π of 0, 1 to variables $x_1 \dots x_i$, define the literal

$$l_i = \begin{cases} x_i & \text{if } \pi(x_i) = 1 \\ x_i' & \text{if } \pi(x_i) = 0 \end{cases}$$

and a product $t_\pi = l_1 \cdot l_2 \cdot \dots \cdot l_n$.

Example

If $\pi(x_1) = 1$ and $\pi(x_2) = 0$ then $t_\pi = x_1 \cdot x_2'$

The **canonical DNF** of E is

$$E^{dnf} = \sum_{E(\pi)=1} t_\pi$$

49

50

Example

If E is defined by

x	y	E
0	0	1
0	1	0
1	0	1
1	1	1

then $E^{dnf} = x'y' + xy' + xy$

Note that this can be simplified to either

$$y' + xy$$

or

$$x'y' + x$$

Exercise

10.2.3 Find the canonical DNF form of each of the following expressions in variables x, y, z

- xy
- z'
- $xy + z'$
- 1

51

52

Exercise

10.2.3 Find the canonical DNF form of the following expressions in the three variables x, y, z .

$$xy = xy \cdot 1 = xy \cdot (z + z') = xyz + xyz'$$

$$z' = xyz' + xy'z' + x'y'z' + x'yz'$$

$xy + z' =$ combine all of the 5 different product terms above

$1 =$ sum of all 8 possible product terms:

$$xyz + x'yz + \dots + x'y'z'$$

NB

Obviously, preferred in practice are the expressions with as few terms as possible.

However, the existence of a uniform representation as the sum of (quite a few) product terms is important for proving the properties of Boolean expressions.

53

For optimisation, the idea is to cover the $+$ squares with the minimum number of rectangles. One *cannot* cover any empty cells (they indicate where $f(w, x, y, z)$ is 0).

- The rectangles can go 'around the corner' / the actual map should be seen as a *torus*.
- Rectangles must have sides of 1, 2 or 4 squares (three adjacent cells are useless).

Exercise

	yz	yz'	$y'z'$	$y'z$
x	+	+		+
x'	+		+	+

$$f = xy + x'y' + z$$

Canonical form would consist of writing all cells separately:

$$xyz + xyz' + xy'z + x'yz + x'y'z' + x'y'z$$

55

Karnaugh Maps

For up to four variables (propositional symbols) a diagrammatic method of simplification called **Karnaugh maps** works quite well. For every propositional function of $k = 2, 3, 4$ variables we construct a rectangular array of 2^k cells. We mark the squares corresponding to the value 1 with eg "+" and try to cover these squares with as few rectangles with sides 1 or 2 or 4 as possible.

Example

10.4.2 Use a K-map to find an optimised form.

	yz	yz'	$y'z'$	$y'z$
x	+	+		+
x'	+		+	+

54

For optimisation, the idea is to cover the $+$ squares with the minimum number of rectangles. One *cannot* cover any empty cells (they indicate where $f(w, x, y, z)$ is 0).

- The rectangles can go 'around the corner' / the actual map should be seen as a *torus*.
- Rectangles must have sides of 1, 2 or 4 squares (three adjacent cells are useless).

Exercise

	yz	yz'	$y'z'$	$y'z$
x	+	+		+
x'	+		+	+

$$f = xy + x'y' + z$$

Canonical form would consist of writing all cells separately:

$$xyz + xyz' + xy'z + x'yz + x'y'z' + x'y'z$$

56

Supplementary Exercise

Exercise

10.6.6(c)

	yz	yz'	$y'z'$	$y'z$
wx	+	+		+
wx'	+	+	+	+
$w'x'$			+	+
$w'x$	+			+

$$f = wy + x'y' + xz$$

Note: trying to use wx' or $y'z$ doesn't give as good a solution

57

Supplementary Exercise

Exercise

10.6.6(c)

	yz	yz'	$y'z'$	$y'z$
wx	+	+		+
wx'	+	+	+	+
$w'x'$			+	+
$w'x$	+			+

$$f = wy + x'y' + xz$$

Note: trying to use wx' or $y'z$ doesn't give as good a solution

58

Boolean Algebras in Computer Science

Several data structures have natural operations following essentially the same rules as logical \wedge , \vee and \neg .

- n -tuples of 0's and 1's with Boolean operations, e.g.

$$\text{join: } (1, 0, 0, 1) + (1, 1, 0, 0) = (1, 1, 0, 1)$$

$$\text{meet: } (1, 0, 0, 1) \cdot (1, 1, 0, 0) = (1, 0, 0, 0)$$

$$\text{complementation: } (1, 0, 0, 1)' = (0, 1, 1, 0)$$

- $\text{Pow}(S)$ — subsets of S

$$\text{join: } A \cup B, \quad \text{meet: } A \cap B, \quad \text{complement: } A^c = S \setminus A$$

59

Example

Exercise

Example 10.1.1 Define a Boolean algebra for the power set $\text{Pow}(S)$ of $S = \{a, b, c\}$

$$0 \stackrel{\text{def}}{=} \emptyset$$

$$1 \stackrel{\text{def}}{=} \{a, b, c\}$$

$$\text{join: } X, Y \mapsto X \cup Y$$

$$\text{meet: } X, Y \mapsto X \cap Y$$

$$\text{complementation: } X \mapsto \{a, b, c\} \setminus X$$

Additional exercise:

Verify that all Boolean algebra laws (cf. slide 39) hold for $X, Y, Z \in \text{Pow}(\{a, b, c\})$

Verify that all Boolean algebra laws (cf. slide 39) hold for $X, Y, Z \in \text{Pow}(\{a, b, c\})$

More Examples of Boolean Algebras in CS

- Functions from any set S to \mathbb{B} ; their set is denoted $\text{Map}(S, \mathbb{B})$

If $f, g : S \rightarrow \mathbb{B}$ then

- $(f + g) : S \rightarrow \mathbb{B}$ is defined by $s \mapsto f(s) + g(s)$
- $(f \cdot g) : S \rightarrow \mathbb{B}$ is defined by $s \mapsto f(s) \cdot g(s)$
- $f' : S \rightarrow \mathbb{B}$ is defined by $s \mapsto (f(s))'$

There are 2^n such functions for $|S| = n$

- All Boolean functions of n variables, e.g.

$$(p_1, p_2, p_3) \mapsto (p_1 + p_2') \cdot (p_1 + p_3) \cdot p_2 + p_3'$$

There are 2^{2^n} of them; their collection is denoted $\text{BOOL}(n)$

Fact

Every finite Boolean algebra satisfies: $|T| = 2^k$ for some k .

Definition

Consider

- Boolean algebra B_1 over a set S with distinct elements $0_S, 1_S$
- Boolean algebra B_2 over a set T with distinct elements $0_T, 1_T$

They are **isomorphic**, written $B_1 \simeq B_2$, if and only if there is a one-to-one correspondence $\iota : S \mapsto T$ such that

- $\iota(0_S) = 0_T$
- $\iota(1_S) = 1_T$
- $\iota(s_1 + s_2) = \iota(s_1) + \iota(s_2)$ for all $s_1, s_2 \in S$
- $\iota(s_1 \cdot s_2) = \iota(s_1) \cdot \iota(s_2)$ for all $s_1, s_2 \in S$
- $\iota(s') = \iota(s)'$ for all $s \in S$

Fact

All algebras with the same number of elements are **isomorphic**, i.e. "structurally similar". Therefore, studying one such algebra describes properties of all.

A cartesian product of Boolean algebras is again a Boolean algebra. We write

$$\mathbb{B}^k = \mathbb{B} \times \dots \times \mathbb{B}$$

The algebras mentioned above are all of this form

- n -tuples $\simeq \mathbb{B}^n$
- $\text{Pow}(S) \simeq \mathbb{B}^{|S|}$
- $\text{Map}(S, \mathbb{B}) \simeq \mathbb{B}^{|S|}$
- $\text{BOOL}(n) \simeq \mathbb{B}^{2^n}$

NB

Boolean algebra as the calculus of two values is fundamental to computer circuits and computer programming.

Example: Encoding subsets as bit vectors.

Summary

- equivalence \equiv , some well-known equivalences (slides 3–4)
- satisfiable formulae, valid formulae (tautologies)
- logical entailment \models
- Proof methods: contrapositive, by contradiction, by cases
- Boolean algebra, CNF, DNF, canonical form

Supplementary reading [LLM]

- Ch. 1, Sec. 1.5-1.9 (more about good proofs)
- Ch. 3, Sec. 3.3 (more about proving equivalences of formulae)
